The A chain is responsible for DNA breakage and rejoining, the B chain catalyzes ATP hydrolysis. The enzyme forms an A2B2 tetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDITIRE 98304088; PubMed=9639935;

Microbiology 144:1647(1998).

-! FUNCTION: NA gyrsae negatively supercoils closed circular doublestranded DNA in an ATP-dependent manner and also catalyzes the interconversion of other topological isomers of double-stranded DNA rings, including catenanes and knotted rings.

-! CATALYMIC ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacteria; Proteobacteria; Deltaproteobacteria; Myxococcales;

-!- CATALYTIC ATT + L-citrulline + L-aspartate = AMP +
diphosphare + L-argininosuccinate seventh step.
-!- PATHWAY: Arginine Diosynthesis; seventh step.
-!- SUBGNIT: Homotetramer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the argininosuccinate synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

-!- CATALYTIC ACTIVITY: 2 H(2)O(2) = O(2) + 2 H(2)O.
-!- COFACTOR: Heme group.
-!- ENZHYE REGULATION: ACTIVATED BY PEROXIDE.
-!- SIMILARITY: Belongs to the catalase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               30-MAY-2000 (Rel. 39, Created)

"An archaebacterial homologue of the essential eubacterial cell
adivision protein ftsZ.";

Proc. Natl. Acad. 621. U.S.A. 93:6726-6730(1996).

-I FUNCTION: This protein is essential to the cell-division process.

It seems to assemble into a dynamic ring on the inner surface of
the cytoplasmic membrane at the place where division will occur,
and the formation of the ring is the signal for septation to
begin. Binds to and hydrolyzes GTP (By similarity).

-!- SUBUNIT: Aggregates to form a ring-like structure (By similarity).

-!- SIMILARITY: Belongs to the ftsZ family.

Proc. Natl. Acad. Sci. U.S.A. 99:1239-12396(2002).
-!- CATALYTIC ACTIVITY: ATP + L-citrulline + L-aspartate = AMP + diphosphate + L-argininosuccinate.
-!- PATHWAY: Arginine biosynthesis; seventh step.
-!- SUBGNIT: Homotetramer (By similarity).
-!- SUBGLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the argininosuccinate synthase family.
Subfamily 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TIGRFAMS; TIGRO0032; argG; I.

                                                                                                                              -i- FUNCTION: Cell surface proteoglycan that may bear heparan sulfate.
--- SUBGELLULAR LOCATION: Type I membrane protein.
--- PTM: O-GLYCOSYLATED WITHIN THE THEYSER-RICH REGION WHICH COULD INTERACT WITH LECTIN DOMAINS ON OTHER MOLECULES (PROBABLE).
--- SIMILARITY: Belongs to the syndecan proteoglycan family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (POTENTIAL).

FUNCTION: Decomposes hydrogen peroxide into water and oxygen, serves to protect cells from the toxic effects of hydrogen peroxide. Could protect cells in nodules which have a high potential to produce hydrogen peroxide because of the strong reducing conditions required for nitrogen fixation and the action of several proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STRAIN=CV. -!- COPACTOR: Heme group.
-!- SUBCELLULAR LOCATION: Periplasmic.
-!- INDUCTION: By hydrogen peroxide.
-!- MISCELLANEOUS: BITHER KATA OR KATC IS ABSOLUTELY REQUIRED FOR THE PROTECTION OF THE NITROGEN FIXATION PROCESS.
-!- SIMILARITY: Belongs to the catalase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                        53 53 BY SIMILARITY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                formation.";

Plant (Call 8:1613-1626(1996).

-!- FUNCTION: Catalyzes the double cyclization reaction which converts

-!- FUNCTION: Catalyzes the double cyclization reaction which converts

-!- PATHWAY: Catchenoid biosynthesis.

-!- SUNCELLULAR LOCATION: Chloroplast.

-!- SUNCELLULAR LOCATION: Chloroplast.

-!- SIMILARITY: Belongs to the lycopene cyclase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;

"Anopheles stephensi Dox-A2 shares common ancestry with genes from
distant groups of eukaryotes encoding a 26S proteasome subunit and is

"I na conserved gene cluster.";

"I ma conserved gene cluster.";

"I subunit: The 26S proteasome is composed of a core protease, known
as the 26S proteasome, capped at one or both ends by the 19S
regulatory complex (RC). The RC is composed of at least 18
different subunits in two subcomplexes, the base and the 11d,
which form the portions proximal and distal to the 20S proteclytic

"I SIMILARITY: Belongs to the proteasome subunit S3 family."

"I SIMILARITY: Belongs to the proteasome subunit S3 family."

"I SIMILARITY: Belongs to the proteasome subunit S3 family."

"I caution, and sclerotization of the cuticle."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thesis (1993), Heinrich-Heine University / Duesseldorf, Germany.
-!- CATALYTIC ACTIVITY: An aldehyde + NAD(+) + H(2)O = an acid +
-!- PATHWAY: Exthanol utilization; second step.
-!- SUBCELLULAR LOCATION: Mitochondrial matrix (Potential).
-!- SIMILARITY: Beloargs to the aldehyde dehydrogenase family.
-!- CAUTION: Is not present in yeast genome.
                                                                                                                                                                                                                                                                                                                     Eukaryota; Fungi, Ascomycota; Saccharomycotina; Saccharomycetes;

RICH.
J. Biol. Chem. 267:24620-24624 (1992).

-!- FUNCTION: Could be involved in defense against microbial infections. Protects the epithelia from external environment.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS:
    Fornt-Alternative splicing; Named isoforms=7;
    Comment-Additional isoforms seem to exist. Experimental confirmation may be lacking for some isoforms;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8 X 8 AA APPROXIMATE TANDEM REPEATS,

Nature 403:665-668(2000).

-I-FUNCTION: DNA motor protein, which is both required to move DNA out of the region of the septum during cell division and for the septum formation. Tracks DNA in an ATP-dependent manner by generating positive supercoils in front of it and negative supercoils behind it (By similarity) formation of a ring between the two cells at the septum that surrounds DNA (By

    similarity).
    SUBCELLULAR LOCATION: Integral membrane protein. Located at the septum. The large C-terminal part of the protein is cytoplasmic (Potential).
    SIMILARITY: Contains 1 PtsK domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ALE 'EVELDIAM').

Nan Q., Bauwe H.,
The C3-C4 intermediate plant Flaveria anomala.";
In Plant Gene Register PGR98-004.

In Plant Gene Portion biosphate cofactor; CO(2) is released and the remaining methylamine moiety is then transferred to the lipoamide cofactor of the H protein.

In Plant Gene Portion + 11poylprotein = S-
aminomethyldihydrolipoylprotein + CO(2).

In CORACTOR: Pyridoxal phosphate.

In SUBUNIT: Homodimer (By similarity). The glycine cleavage system is composed of four proteins: P, T, L and H.

SUBLULAR LOCATION: Mitochondrial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. -1-SUBCELLULAR.

-1-SUBCELLULAR.

-1-TISSUE SPECIFICITY: HIGHLY EXPRESSED IN THE THYMUS. ALSO FOUND IN THE ORAL MUCOSA, PRAATHYROID GLAND, BARRHOLIN'S GLANDS, TONSILS, AND VAGINAL BPITHELIUM. VERY LOW LEVELS ARE DETECTED IN LUNG, KIDNEY, AND PROSTATE.

-1-DOMAIN: CONTAINS AT LEAST ONE ACTIVE INHIBITORY DOWAIN FOR TRYPSIN (DOWAIN 6).

-1-DISEASE: Defects in SPINKS are the cause of Netherton syndrome (NS) [MIN'256500], a severe autosomal recessive disorder. It is characterized by congenital ichthyosis with defective characterized by congenital ichthyosis with defective cornification, a specific hair shaft defect known as trichorrexis invaginata or "bamboo hair", atopic dermatitis, and hayfever. High
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Maegert H.-J., Staendker L., Kreutzmann P., Zucht H.-D., Reinecke M., Sommerhoff C.P., Fritz H., Forssmann W.-G.; LEKTI, a novel 15-domain type of human serine proteinase inhibitor."; J. Osatomi K., Sumiyoshi H.;

Virology 176:643-647(1990).

I. Virology 176:643-647(1990).

I. CARLYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

I. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA)(N).

C. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA)(N).

C. SUBUNIT: The virion of this virus is a nucleocapsid covered by a lipportein m and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-AUG-1992 (Rel. 23, Created)

Genome polyprotein (Contains: Capsid protein C (Core protein); Matrix protein (Envelope glycoprotein M); Major envelope protein E;
Nonstructural proteins NSI, NS2, NS4A and NS4B; Protease/helicase (EC 3.4.21.98) (NS3); RNA-directed RNA polymerase (EC 2.7.7.48)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dengue virus type 3.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
Flavivirus.
                  -!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.
-!- SUBCELDULAR LOCATION: Outer membrane (By similarity).
-!- DOMAIN: CONTAINS 153 IMPERFECT REPEATS OF THE CONSENSUS OCTAPPETIDE A-G-Y-G-S-T-L-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.
-!- MISCELLANSOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICH NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
-!- SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Yuan Z.-H., Zhao G.-P., Qu D., Danchin A., Wen Y.-M.;
Genome-based analysis of virulence genes in a non-biofilm-forming Staphylococcus epidermidis strain (ATCC 12228).";
Mol. Microbiol. 49:1577-1533 (2003).
-!-FUNCTION: Transforms pimelate into pimeloyl-CoA (By similarity).
-!- CATALYTIC ACTIVITY: ATP + 6-carboxyhexanoate + CoA = AMP + diphosphate + 6-carboxyhexanoyl-CoA.
-!- CATALYTIC ACTIVITY: ATP + 6-carboxyhexanoate + CoA = AMP + diphosphate + 6-carboxyhexanoyl-CoA.
-!- CATALYTIC Belongesium (By similarity).
-!- PATHWAY Bioconversion of pimelate into dethiobiotin.
-!- SIBUNIT: Homodimer (By similarity).
-!- SIBUNIT: Belongs to the biow family.
                                                                                                                                                                                                                                                                                            Ostendorf T., Cherepanov P., Jekel M., de Vries J., Wackernagel W.; Submitted (JUN-1994) to the EMBL/GenBank/DDBJ databases.

Protein antigen from Pseudomonas aeruginosa and its antigenic fragments - useful diagnostically to detect specific antibodies, particularly in patients with cystic fibrosis, and as vaccines.

Claim 3; Page 2; 23pp; English.

This peptide is the N-terminal fragment of a novel Pseudomonas aeruginosa protein antigen, Pa60. This fragment could be used for diagnostic detection of P. aeruginosa by forming complexes with specific antibodies, particularly in patients with cystic fibrosis (by analysis of mucus, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes antigenic Pseudomonas aeruginosa proteins (P1). The P. aeruginosa proteins have antibacterial activity and can be used in vaccines and as antagonists. The proteins or their fragments, or antibodies are useful in the detection and/or diagnosis of P. aeruginosa. They are also useful for producing a vaccine and inducing an immune response against P. aeruginosa infection. An agent capable of antagonising, inhibitung or otherwise interfering with the function or expression of P1 are useful in the manufacture of a medicament for the reatment or prophylaxis of P. aeruginosa infections. The present sequence from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antigenic Pseudomonas aeruginosa proteins, useful in the detection and/or diagnosis of P. aeruginosa infections and for producing vaccines against P. aeruginosa.

the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense continuous applyability of a promoter operably linked to the nucleic acid (1) polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide, (5) producing the polypeptide; (6) inhibiting cellular to proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) required for proliferation. Or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising strains in which the gene compound that inhibits the strains; or (13) identifying the trasget of a compound that inhibits the confideration of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for required for proliferation in cells other than S. anreus, S. typhimurium,
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences of the caracteristics.

K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zyskind JW;

organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of trains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational crud discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, X. pneumoniae or P. acruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a library of DNA fragments of Escherichia colistrains comprising polynucleotides (ABA88577-ABA88199) and ABA89533) and encoded proteins (ABB5494-ABB82919 and ABB52954-ABB531994) of nature B2/D+A-. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E colifactions. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of nature B2/D+

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a deoxyribokinase enzyme. This enzyme is involved in the biosynthesis of deoxyribonucleosides, and is used in the method of the invention. The specification describes a method for the invitro enzymatic synthesis of deoxyribonucleosides. The method comprises reacting deoxyribose 1-phosphate and a nucleobase to form a deoxyribonucleoside and an inorganic phosphate. Enzymes which may be used in the method of the invention include thymidine phosphorylase, prine nucleoside phosphorylase, phosphopentose mutase, phosphopentose aldolase, fructose 1,6-diphosphate aldolase, deoxyribokinase, and nucleoside 2-deoxyribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                         In vitro enzymatic synthesis of deoxyribonucleosides comprises reacting deoxyribose 1-phosphate and a nucleobase to form a deoxyribonucleoside and an inorganic phosphate.
                                                                                                                          Deoxyribonucleoside; deoxyribose 1-phosphate; thymidine phosphorylase; purine nucleoside phosphorylase; phosphopentose mutase; phosphopentose aldolase; fructose 1,6-diphosphate aldolase; deoxyribokinase; nucleoside 2-deoxyribosyltransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antiense nucleic acid; (2) a host cell containing the vector; (3) an isolated attributed propertied, or its fragment whose expression is inhibited by the antiense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a game in an operon required for the activity of a game in an operon required for the proliferation, (7) identifying a compound that inhibits proliferation of the proliferation or that has an activity against a biological pathway in which a proliferation or that the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a gene required for required for the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound,'s activity; (11) a culture comprising strains in which the gene or underexpressed, in a culture or collection of an organism. The antisense uncleic acids act useful for proliferation of an organism. The antisense uncleic acids act useful for cellular proliferation in cells other than S. typhimurium, K. preumoniae or P. aeruginosa. The present sequence is encoded by one of the terget proliferation in cells other than S. urrens, S. typhimurium, K. preumoniae or P. aeruginosa. The present sequence is encoded by one of the terget proliferation in cells other than S. aureus, S. typhimurium, C. the recent discourse of the proliferation in cells other than S. aureus, S. typhimurium, C. the required for proliferation in cells other than S. aureus, S. typhimurium, C. the required for proliferation in cells other than S. aureus, S. typhimurium, C. the present and one ferromed and one ferromed and o
                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid comprising any one of

The invention relates to an isolated nucleic acid comprising any one of

Claim 25; SEQ ID NO 51339; 1766pp; English.

```
The invention relates to isolated nucleic acids encoding plant stress response proteins (including peptide-methionine sulphoxide reductases) appearing as ABUS6848-ABUS6846 (or a protein 80% identical to them) from Zea mays, Oryza sativa, Glycine max, or Triticum aestivum. Also included are expression cassettes, transformed host cells, transganic plants/seeds, modulating the level of peptide-methionine sulphoxide reductase in a plant and a computer system/data processing system for identifying, analysing, or modelling a genetic sequence. The plant reductase in a plant and a computer system/data processing system for identifying, analysing, or modelling a genetic sequence. The plant response to stress (e.g. drought, heat, radiation or pathogen attack), engineering plants with increased disease and stress resistance, manipulating DNA repair and recombination efficiency, manipulating intracellular protein transport, and improving/protecting grain flavour. The nucleic acids may also be used as probes or amplification primers in the detection, quantitation or isolation of gene transcripts, for recombinant expression of encoded polypeptides, as immunogens in preparing or screening cantibodies, and in sense or antisense suppression of one or more genes in antisense to obtain antibodies specifically immunogens in antisense to obtain antibodies specifically immunogens or antisense or antisense antisense or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

the fill and relates to an interact actu compitating any one of the fill and relates to an interaction of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of against a biological pathway compliced for proliferation or that inhibits cellular proliferation; (8) identifying a gene enclived for cellular proliferation or the biological pathway in which a proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a gene or which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a civitty; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the printip or (13) identifying the erraget of a compound that inhibits the proliferation of an organism. The antisense mucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational cellular proliferation to isolate candidate molecules for rational drug provelines and present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence date for this provers in the present sequence date for this provers in the printing of the pri

The present invention relates to the genome sequence of Listeria

C monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of

it are useful for selecting probes and primers for detecting genes in L.

CC it are useful for selecting probes and for studying genetic

conceptogenes and related organisms, and for stocking expressed from the genome sequence of the present invention. Proteins

continuously independent of L. monocytogenes and related organisms, and

continuously independent and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication

confidence in monocytogenes-related diseases. In addition, the genome

conducted in monocytogenes-related diseases. In addition, the genome

conducted in seconds by it are useful in pharmaceutical and

concorpusations for the treatment or prevention of infections by L.

concorpogenes and related organisms. Note: The sequence data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating call signalling and call-call interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical furge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB27072). The sequence data for this parefent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes consisted and the encoded proteins. The prokaryotes used are Escherichia Staphylococcus arcanis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibiodies capable of binding to the express these proteins, and to obtain antibodies capable of binding to the express these proteins can be used to screen compounds in rational drug discovery programmes. The nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent cid not form part of the printed specification, but was obtained in electronic format directly from WIPO at the way obtained in the way obtained in the present sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to a novel isolated nucleic acid molecule involved in production of benzodiazepines, in particular anthramycin. The protein cencoded by the novel nucleic acid of the invention or a protein of 200 consecutive amino acids of that protein are useful for modifying a consecutive amino acids of that protein are useful for modifying a consecutive amino acids of that protein are useful for modifying a consecution, preferably Escherichia coll strain DH10B having accession nose DAC 040602-1 and DDAC 040602-2, is useful for producing an anthramycin compound or anthramycin analogue. The genes and proteins provide the machinery for producing novel compounds to producing novel compounds and allow direct manipulation of anthramycin and related chemical structures via chemical engineering of the enzyme involved in the bosynthesis of anthramycin, modifications which may not be presently cossible by chemical methodology because of complexity of the structures. The genes and proteins are also useful to introduce chemical and proteins are also useful to introduce chemical compound for normally inert positions that permit subsequence chemical compound for normally inert positions that permit subsequence chemical confidence of into normally inert positions that permit subsequence chemical confidence or andidate to fine-tune the compound for optimal properties. The mucleic acids are calds may be used as probes to identify and isolate DNAs encoding polypeptides are useful in a variety of biochemical cantiner propagating the enzymes involved in the synthesis of anthramycins. The polypeptides are useful in a variety of biochemical cantiner and for generating encolonal or polyclonal antibodies. This incomical candidates and proteins and benzodiazepines biosynthesis protein of the
structures by chemical engineering of enzymes involved in anthramycin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABB60583
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                           This invention describes the isolation of a novel HIV-type retrovirus called MVP-5180/91 (BCACC V 92092318). Antigens produced from this product can be used in an assay kit for detecting antibodies against viruses that cause immune deficiency, preferably where the assay is a Western blot, ELISA or fluorescence immunoassay. MVP-5180/91, cDNA and/or antigen can be used for detecting retroviruses that cause immune deficiency and to prepare vaccines. This sequence represents an HIV MVP 5180 gag protein. The invention relates to a novel G protein-coupled receptor (GPCR) polypeptide and its polymucleoride. The polypeptide is useful for preventing or abrogating insect or nematode infestation of a plant. G polypeptide is useful in cell therapy. The present sequence is fruit

                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                        1.8
                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide, useful for preventing or abrogating insect or nematode infestation of a plant.
                detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell.
                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fruit fly, G protein-coupled receptor; GPCR; cell therapy; nematode; insect infestation; insecticide; nematocide; receptor.

                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical furge. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidates, therapeuticis and pharmaceutical furgs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABL3070). The sequence date for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification, signal transduction pathway, metabolic pathway, hybridisation assay, genetic mapping, gene expression control, promoter, termination sequence.
                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5; Indels 1; Gaps

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FOR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic mino acid sequences. ABG00010-ABG30377 represent novel human diagnostic partent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                             New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                   Claim 20; SEQ ID NO 56698; 103pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Acinetobacter baumannii protein #3013.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADA35852 standard; protein; 145 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (GENO-) GENOME THERAPEUTICS CORP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Alloiococcus otitidis polymucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated polynucleotide (I) of Alloicoccus otitidis genomic DNA, which encodes an antispenic protein. Alloicoccus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I), its complement, degenerate variant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2);
           New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                    The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnossing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii present sequence represents the amino acid sequence of an A. baumannii protein.
                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alloiococcus otitidis, antigenic protein, immunogenic, immunisation, gene therapy, Gram-positive bacterium; infection.

composition comprising the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polymucleotide that is comprised in the equivalent or fragment, or the polymucleotide that is comprising the polypeptide of (1) and a carrier, (7) a protein chip comprising the polypeptide of (1), their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus immunogenic composition; (9) detecting and/or identifying Alloiococcus cutidis in the biological sample; (10) a kit comprising a container containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the genetically engineered host cell under conditions suitable to produce the polymucleotides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials. The polymucleotides are useful for expressing and detecting Alloiococcus otitidis. The present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-AUG-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Legrain P;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABG77349;
```

The invention relates to a complex between two interacting Saccharomyces cerevisiae polypeptides, comprising two Selected Interacting Domain (SID) polypeptides as bait and prey proteins. A pharmaceutical composition comprising the complex is useful for preventing or treating Candida infection, cancer and neurodegenerative diseases in a human or animal,

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, coryneform bacterium are useful for producing amino acids, nucleic acids, vitamins, sacoharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yokoi H;

Allison JP, Fasso M, Shastri N;

WPI; 2002-362424/39. N-PSDB; AAD35418. New SPAS-1 protein or antigen obtained from TRAMP-C2 tumor cells, useful as vaccine for treating or inhibiting cancer in patient, e.g. prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney or germ cell cancer

Claim 2; Fig 1A; 107pp; English.

The invention relates to compounds and methods for inducing protective immunity against cancer. The compounds provided include polypeptides that concent at least one immunogenic portion of one or more SPAS-1 protein and DNA molecules encoding them or antigen obtained from transgenic portion of the SPAS-1 human homologue polymucleotides sequence, SPAS-1 antibody or its antigen-binding fragment, the antigen- presenting call, the T cell population and the pharmaceutical compositions are useful for inhibiting the development of a cancer in a patient, specifically prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney, prostate, breast useful as vaccines for inducing protective immunity against cancer. They are also useful for diagnosing cancer and monitoring against progression. The present sequence is murine SPAS-1 partial protein

The compounds provided include polypeptides that contain at least one immunogenic portion of one or more SPAS-1 protein and DNA molecules encoding them or antigen obtained from transgenic adenocarcinoma mouse prostate (TRAMP)-C2 tumour cells. The immunogenic portion of the SPAS-1 human homologue polynucleotides sequence, SPAS-1 antibody or its antigen-binding fragment, the antigen- presenting cell, the T cell population and the pharmaceutical compositions are useful for inhibiting the development of a cancer in a patient, specifically prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney, chronic lymphocytic leukaemia or germ cell cancer. In particular, these compounds are useful as vaccines for inducing protective immunity against cancer. They are also useful for diagnosing cancer and monitoring cancer progression. The present sequence is murine tumour SPAS-1 mutant protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New SPAS-1 protein or antigen obtained from TRAMP-C2 tumor cells, useful as vaccine for treating or inhibiting cancer in patient, e.g. prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney or germ cell
                                                                                                                                                                Murine; protective immunity; cancer; SPAS-1; T cell; pharmaceutical; prostate; breast; cervix; ovary; placents; colon; brain; lung; kidney; chronic lymphocytic leukaemia; germ cell; vaccine; cytostatic; TRAMP; transgenic adenocarcinoma mouse prostate; mutant; mutein.

The invention relates to an isolated mucleic acid comprising any one of the folly antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or the activity of a gene in an operon required by the proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the activity of the gene product or that has an activity adainst a biological pathway to required for proliferation, or that inhibits cellular proliferation; (8) identifying a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a pertent of a compound; a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism costs; (9) manufacturing an antibiotic; (10) profiling the extent of proliferation of an organism. The artitions of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for the proliferation in cells other than S. articional drug discovery programs, or for screening for homologous nucleic acids for this patent did not form part of the printed specification, but was obtained in electronic format directly from which each sequences are from the proliferation in electronic format directly from which acids for this format di
                                                                                                                                                                                                                    Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or scre
for homologous nucleic acids required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                        Protein encoded by Prokaryotic essential gene #24468.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 25; SEQ ID NO 66865; 1766pp; English.

diagnosing, preventing and treating cardiovascular disorders, such as atherosclerosis, cardiac hypertrophy, ischaemia, reperfusion injury, restenosis, arterial inflammation, vascular wall remodeling, coronary microembolism, tachycardia, bradycardia, pressure overload, aortic disease, including but not limited to, valvular degeneration caused by calcification, rheumatic heart disease, endocarditis, or complications of artificial valves; atrial fibrillation, long-QT syndrome, congestive artificial valves; atrial fibrillation, ingoins, heart failure, sinus node dysfunction, angins, heart failure, confidence of hypertension, atrial fibrillation, artial flutter, pericardial disease, including but not limited to, pericardial effusion and pericardial cardiomyopathis, e.g. dilated cardiomyopathy or idiopathic cardiomyopathy, myocardial infarction, ocronary artery spasm, ischaemic disease, arhythmia, sudden cardiac death and cardiovascular developmental disorders. The methods may also be used for identifying compounds that modulate cardiovascular disorders. Sequences given in Abball69 represent the genes and proteins that may be regulated by a compound of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                               6
```

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention

ID NO 30690; 21pp + Sequence Listing; English.

detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

New isolated nucleic acid genes from Drosophila and interactions.

The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the against a polypeptide of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody polynucleotides or polypeptides of the invention; and methods of invention and methods of invention and methods of invention further discloses methods of peventing, treating or ameliorating a medical condition, kits comprising polynucleotide probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; neucodegenerative diseases; anaemas; platelet disorder; wound; burns; ulcers; osteoporosis; atteinmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neucoprotective; antianaemic; anticoagulan; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatlic; gene therapy; chromosome 11.
discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB5737-ABB57072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wehrman T;

and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the expression or activity of the polymucleotide and/or polymeptide; and 767 contig sequences corresponding to the CDNA sequences of the invention (ADC31861-ADC32627) and the polympetides encoded by the contigs (ADC32628 - ADC33394). The inclaid acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing blodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alrheimer's diseases and other neurodegenerative diseases, anaemia, platelet chismates and in the recombinant production of a protein. The polypeptides cancer. The nucleic acids may also be used as hybridisation probes or correct also useful in generating antibodies, as molecular weight markers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a human contiguence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO can fitp.wipo.int/pub/published\_pot\_sequences.

detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell isolated nucleic acid genes

Disclosure; SEQ ID NO 41325; 21pp + Sequence Listing; English.

i. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and

insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL161840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences cell-cell interactions in higher eukaryotes for the development of 8888888888
